PROFESSIONAL LAWN AND TREE CARE

WORKING TOGETHER FOR A LAWN THAT'S MORE THAN BEAUTIFUL

## O C P ORGANIC LAWN PROGRAM

The foundation of the **OCP** program consists of 5 visits. Depending on conditions in your lawn, additional or supplemental visits may be recommended at an additional cost. An outline of this program is listed below:

**ROUND 1** - A blend of corn-gluten and beneficial soil microbes that provides an organic source of slow release nitrogen, while helping to suppress the amount of grassy weeds, like crabgrass.

**ROUND 2** - An organic based fertilizer containing bio-stimulants and beneficial microbes to enhances root growth, promote healthy top growth and provide essential micro-nutrients.

**ROUND 3** - An organic based fertilizer, low in soluble salts that enhances root density, maximizes nutrient uptake and provides increased tolerance from heat and/or drought stresses.

**ROUND 4** - A blend of corn-gluten and beneficial soil microbes that provides an organic source of slow release nitrogen, while helping to suppress the amount of grassy weeds, like crabgrass.

**ROUND 5** - An organic based fertilizer containing bio-stimulants and beneficial microbes to enhance plant vigor, winter hardiness and improve spring recovery.

*Proper mowing and watering are crucial for good results - Your technician will provide this, along with other pertinent agronomic information, with each visit.*

The **OCP** program offers the flexibility of using IPM procedures to determine if pest control products may be needed to help solve turf problems where there are no viable organic alternatives available. It may be necessary for a combination of organic products and applications containing pest controls to get weed and/or insects under control. We will advise you as to the best approach based on conditions in your lawn

**SUPPLEMENTAL SERVICES** - These optional services are offered to supplement the regular program as well as address any special problems in the lawn. They are priced separately and require customer approval.

**CORE AERATION** - A mechanical process that involves removing cores of soil from the lawn. Cores are broken up with subsequent mowing. This helps to reduce thatch build up and soil compaction. It also encourages clumpy turf to fill in with new growth.

**SOLU-CAL® ENHANCED LIME** - This will help to neutralize soil acidity to increase nutrient availability and increase fertilizer response in turfgrass.

**SUPRISOIL® LIQUID SOIL CONDITIONER** - an organic, liquid aeration compound. This product contains 11 different types of bio-degradable polymers, which will work their way through 100% of the soil profile. This will help reduce soil compaction more effectively than mechanical aeration alone. As a result, your soil will be better conditioned to absorb nutrients and will have better drainage capacity.

**MERIT® PREVENTATIVE GRUB CONTROL** - Synthetic, granular fertilizer combined with Merit grub control to reduce the threat of white grubs.

**DISEASE CONTROL TREATMENTS** - Lawn diseases originate in the soil and flare up when conditions are favorable. While fertilizer and adjustments in mowing/watering may help, control treatments may be needed to aid in the control of more severe outbreaks.
